Work Allocation Among Team Members

A well-defined work allocation strategy is essential for the successful execution of any software project. Assigning responsibilities according to each team member's skills improves productivity, ensures accountability, and promotes effective collaboration throughout the project lifecycle. The following work allocation clearly defines the primary responsibilities of each team member while encouraging teamwork and shared ownership of the project.

1. Shafna KN – Backend Development

Shafna KN is responsible for developing the server-side components of the application. Responsibilities include designing and implementing APIs, managing business logic, integrating databases, ensuring secure communication, optimizing backend performance, handling authentication, fixing server-side bugs, and supporting deployment activities.

2. Karthik Prasad – Frontend Development

Karthik Prasad is responsible for developing the user interface of the application. Duties include creating responsive web pages, implementing interactive features, integrating frontend components with backend services, improving usability, and ensuring a smooth user experience across different devices.

3. Akshara M – UI/UX Designing

Akshara M is responsible for designing the visual appearance and user experience of the project. This includes creating wireframes, interface layouts, icons, color schemes, typography, and other design assets while ensuring consistency, accessibility, and an intuitive user experience.

4. Archana Sudhakaran – Backend Development

Archana Sudhakaran contributes to backend development through database management, API implementation, backend testing, debugging, performance optimization, and integration of server-side modules to ensure reliable and scalable application functionality.

Shared Responsibilities

In addition to their primary roles, all team members actively participate in documentation, requirement analysis, testing, debugging, code reviews, version control, project planning, presentations, deployment support, and maintenance. These responsibilities are divided equally among the members to promote collaboration, balanced workload, timely completion of milestones, and successful delivery of the project.

Conclusion

The work allocation ensures that every major component of the project is assigned appropriately while fostering teamwork and accountability. This balanced distribution of responsibilities enables efficient development and contributes to the successful completion of the project.
